

# DYNAMIC PROGRAMMING

## PART II

---

Lecture 5.1, CMSC 142

# Today's Topics

- Longest Common Subsequence

# Longest Common Subsequence

- X is a subsequence of Y if X is obtained from dropping or removing 0 or more elements of Y, preserving the relative order of elements
- Whereas in a substring the elements need to be contiguous, it need not be for subsequences
- Example: "ad" is a subsequence of "abcde", by dropping b,c,e

# Common subsequence

- Given two subsequences A and B, C is a common subsequence of A and B if the subsequence C appears in both A and B

# Longest Common Subsequence

Input:

- Sequences  $A = \{a_1, a_2, \dots, a_m\}$  and  $B = \{b_1, b_2, \dots, b_n\}$

Output

- Sequence  $C = \{c_1, c_2, \dots, c_p\}$  where  $C$  is a subsequence of both  $A$  and  $B$  (common subsequence) and it is the longest possible common subsequence (common subsequence with the longest length)

# Example

- A = "abcde", B = "bceadq"
- Common subsequences: "bcd", "ad", "bce", "be", "bd", "bc"
- LCS: "bcd", "bce"

# LCS

- Goal: Find a longest common subsequence(A,B)
- Note: 'a' longest common subsequence, not 'the' LCS, since there might be more than one

# Motivation

- length of  $\text{LCS}(A,B)$  = similarity between A and B
- The longer the length of LCS, the more similar A and B are
- Usage: DNA sequences, misspelled word, autocomplete

# Activity

- List (with Ranking) of TV Shows You Like:
- Heroes, Gossip Girl, Awkward, How to Get Away with Murder, Friends, Big Bang Theory, HIMYM, Sherlock, Game of Thrones, American Horror Story, Agents of SHIELD, Arrow, Once Upon A Time, The Walking Dead, Grey's Anatomy, The Flash

# Question

How can we solve this problem?

NOOBgrammer says...

Use **Brute-force**  
approach.

# Brute-force Algorithm

- Generate all possible subsequences of A (length  $m$ )
- Check which are also subsequences of B (length  $n$ )
- Retain the longest subsequence (only one)

# Question

- Will it return the correct answer?
- NO

# Question

- Will it be fast? NO

# Analysis

- All possible subsequences of  $A = 2^n - 1$
- Example: "1234" has 15 subsequences

# Analysis

- Checking if subsequence of A is also subsequence of B =  $O(n)$  time per subsequence
- Worst-Case RT =  $O(n2^m)$  [exponential time]

Can we do better?

PROgrammer says..

Use DP approach!

# Optimal Substructure

- First, we need to characterize a longest common subsequence
- The LCS problem has an optimal substructure property: optimal solutions to the subproblems contribute to the optimal solution of the given problem

# Idea

Example:

A = "ABCD"

B = "BCDEF"

LCS = "BCD"

Example:

A = "ABCD"

B = "BCDE"

LCS = "BCD"

# Idea

Example:

A = "ABCD"

B = "BCDEF"

LCS = "BCD"

Example:

A = "ABCD"

B = "BCDE"

LCS = "BCD"

# Idea

Example:

- A = "ABC"
- B = "BCDE"
- LCS = "BC"

Example:

- A = "ABC"
- B = "BCD"
- LCS = "BC"

# Idea

Example:

- $A = \text{"AB"}$
- $B = \text{"BCDE"}$
- $\text{LCS} = \text{"B"}$

Example:

- $A = \text{"AB"}$
- $B = \text{"BCD"}$
- $\text{LCS} = \text{"B"}$

# Example

String 1: BDCABA

String 2: ABCBDAB

What's the LCS of the two strings?

		B	D	C	A	B	A
A							
B							
C							
B							
D							
A							
B							

match!

no match!

$$C_{i,j} = \begin{cases} 0 & \text{if } i=0 \text{ or } j=0 \\ C_{i-1,j-1} + 1 & \text{if } a_i = b_j \\ \text{Max}(C_{i,j-1}, C_{i-1,j}) & \text{if } a_i \neq b_j \end{cases}$$

# Example

String 1: BDCABA

String 2: ABCBDAB

What's the LCS of the two strings?

		B	D	C	A	B	A
A

# Optimal Substructure

- The subproblems correspond to pairs of "prefixes" of the two input sequences
- LCS of two sequences contains within it an LCS of prefixes of 2 sequences

# Prefix

Given a sequence  $A = \{a_1, a_2, \dots, a_n\}$ , we define the  $i$ th prefix of  $A$ , for  $i = 0$  to  $n$ , as  $A_i = \{a_1, a_2, \dots, a_i\}$

- Example:  $A = \text{"ABCBDAB"}$
- $A_4 = \text{"ABCB"}$
- $A_0 = \text{""}$

# Theorem

- Let  $A = \{a_1, a_2, \dots, a_n\}$  and  $B = \{b_1, b_2, \dots, b_m\}$  be subsequences, and let  $C = \{c_1, c_2, \dots, c_k\}$  be any LCS of A and B

## Step 2

- Recursively Defining Value of Optimal Solution
- Theorem implies that there are either one or two subproblems to examine when finding LCS of A and B

# Subproblems

If  $a_n = b_m$ , we must find LCS of  $A_{n-1}$  and  $B_{m-1}$  :

- appending  $a_n = b_m$  to this LCS yields an LCS of A and B

If  $a_n \neq b_m$ , we must solve two subproblems :

- finding an LCS of  $A_{n-1}$  and B and finding an LCS of A and  $B_{m-1}$  .
- Whichever of the two is longer is an LCS of A and B

# Subproblems

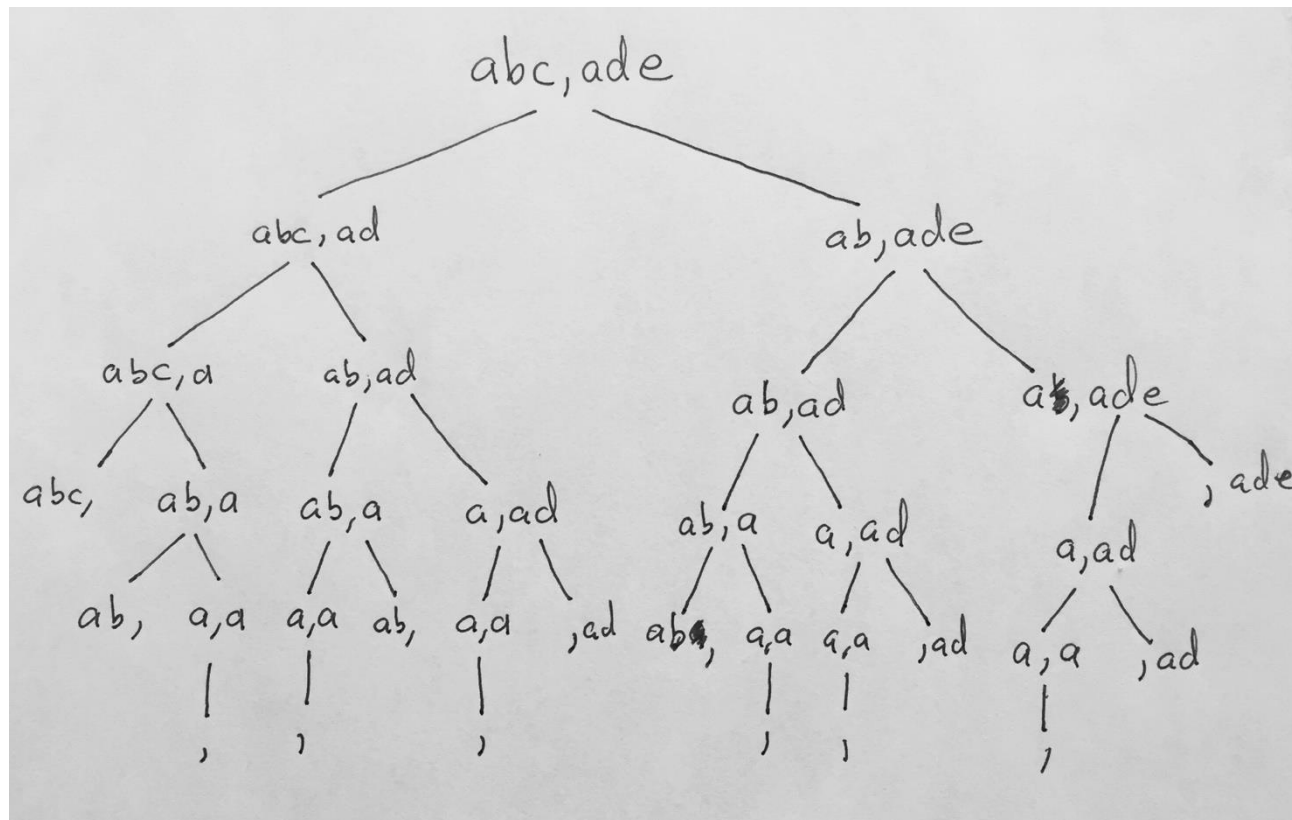

- Because these three cases exhaust all possibilities, we know that one of the optimal subproblem solutions must be used within an LCS of A and B
- Can you already see the overlapping subproblems?

# Overlapping subproblems

To find LCS of A and B, we may need to find the LCS of  $(A_{n-1}, B)$  and  $(A, B_{m-1})$

- But each of these subproblems has the subsubproblem of finding the LCS of  $A_{n-1}, B_{m-1}$
- Many other subproblems share subsubproblems

# Overlapping Subproblems

- <https://www.usna.edu/Users/cs/wcbrown/courses/S18SI335/lec/l20/lec.html>

# Recurrence relation

$c[i,j]$  = length of an LCS of the sequences  $A_i$  and  $B_j$

$$C_{i,j} = \begin{cases} 0 & \text{if } i=0 \text{ or } j=0 \\ C_{i-1,j-1} + 1 & \text{if } a_i = b_j \\ \text{Max}(C_{i,j-1}, C_{i-1,j}) & \text{if } a_i \neq b_j \end{cases}$$

# Value of the optimal solution

- It also maintains the table  $d[1..m, 1..n]$  to simplify the construction of an optimal solution
- Intuitively,  $d[i, j]$  points to the table entry corresponding to the optimal subproblem solution chosen when computing  $c[i, j]$

# Value of optimal solution

- Compute the length of LCS by defining a procedure `LCS_LENGTH` that takes two sequences A and B as inputs
- It stores the  $c_{[i,j]}$  values in a table  $c_{[0..m,0..n]}$  ( $m \times n$  table) whose entries are computed in row-major order (first row, LTR, second row, LTR, so on)

# LCS\_LENGTH

**LCS\_LENGTH (A,B)**

```

1  m = length(A), n = length(B)
2  for i = 1 to m
3      c[i,0] = 0
4  for j = 0 to n
5      c[0,j] = 0
6  for i = 1 to m
7      for j = 1 to n
8          if ai == bj
9              c[i,j] = c[i-1, j-1] + 1
10             d[i,j] = "↖"
11         else
12             if c[i-1,j] ≥ c[i,j-1]
13                 c[i,j] = c[i-1,j]
14                 d[i,j] = "↑"
15             else
16                 c[i,j] = c[i,j-1]
17                 d[i,j] = "←"
18  return c and d

```

# Analysis

- The LCS\_LENGTH procedure runs in  $O(mn)$  time
- Filling up a  $m \times n$  table =  $mn$  time  $O(1)$  time to compute each entry

# Constructing LCS

- Step 4 is constructing the optimal solution from the computed info
- The d table returned by `LCS_LENGTH` can be used to quickly construct an LCS of A and B

# Constructing LCS

- Begin at  $d[m,n]$  and trace through the table following the directions
- Using this method, we will encounter the LCS in reverse order

# Print LCS

- We can use a recursive procedure to print out the LCS of A and B in the proper, forward order
- Initial Invocation: `PRINT_LCS(d,A,length(A),length(B))`

# PRINT\_LCS

```
PRINT_LCS (d, A, i, j)
1      if i == 0 or j == 0
2          return
3      if d[i,j] == "↖"
4          PRINT_LCS (d, A, i-1, j-1)
5          print ai
6      else if d[i,j] == "↑"
7          PRINT_LCS (d, A, i-1, j)
8      else if d[i,j] == "←"
9          PRINT_LCS (d, A, i, j-1)
```

# Analysis

- Procedure takes  $O(m+n)$  time
- At least one of  $i$  and  $j$  is decremented in each stage of the recursion

**X = "HELLOWORLD" Y = "HOLDTHELINE"**

### Example of Multiple LCS

Given Strings:

•X= "ACDBE"

•Y= "ABCDE"

The **LCS length = 4**, and we have **two possible LCS**:

1. "ACDE" (Following a diagonal path choosing "A → C → D → E")

2. "ABDE" (Following another diagonal path choosing "A → B → D → E")

X \ Y	∅	A	B	C	D	E
∅	0	0	0	0	0	0
A	0	1	1	1	1	1
C	0	1	1	2	2	2
D	0	1	1	2	3	3
B	0	1	2	2	3	3
E	0	1	2	2	3	4
